

Practice Solution: Formatted Receipt

By: Megan Avery
Updated August 2018

Formatted Receipt

Edit the receipt program from the Types, Variables, and Expressions tutorial to include the name of the customer on the receipt and have the values formatted to 2 places after the decimal. Also, make the alignment look like a normal restaurant receipt with the information on the left and the dollar information with the appropriate currency symbol on the right.

Example Output:

Mr/Mrs.[name] your totals are:

Subtotal: \$36.75

Subtotal with tax: \$39.69

Tip: \$5.95

Total: \$45.64

The End
